External login kit for IceWarp WebMail Pro

External login kit contents

login.html
login.js
login_auto.html
proxy.php.safe
rsa.js

File location

All files from *"Merak/html/webmail/client/_external/"* should be placed in your external site folder structure.

External login configuration

login.html

Include the code of this file to the web page you wish to externally log in from into the WebMail Pro interface. No modifications of this file are required.

login.js

Edit only the line beginning with:

"this.sClientUrl = 'http://localhost:32000/ "

where "http://localhost:32000/" should be replaced by URL where Webmail Pro is running and accessible.

login_auto.html

ONLY for IceWarp partners and resellers. Allows users to automatically login into demo accounts (disabled by default).

proxy.php.safe

For security reasons, this file have to be renamed to "proxy.php".

This file is crucial for external login to work. If this file is not configured correctly, you will not be able to successfully login into WebMail Pro externally.

This file provides redirection from an external site to a running WebMail Pro site.

Lines you need to modify:
$host = "merakdemo.com";
$path = "/webmail/server/webmail.php";
$port = 32000;

For "$host", enter a short address (hostname) of your WebMail Pro installation (e.g. 127.0.0.1, domain.com).

For "$path", enter the correct path to webmail/server/webmail.php file. If WebMail is running directly on the host address (domain.com/webmail), leave the default "/webmail/server/webmail.php".

Parameter "$port" is self-explanatory, enter the correct port for your web server where WebMail Pro is running.

rsa.js

No modifications to this file are required.
